MAINTAINING YOUR WONDERCAP DRAINAGE SYSTEM

For All Constructions

Maintaining your Wondercap Drainage System "Internal Base"

Step 1:

Firstly, look down inside the grate in your bathroom to see if there's any residue from construction, black stains or appears dull and grimy. If so, the Wondercap Base is due for a clean.

Step 2:

- The grates normally have an external ring to grout to and an internal ring to gain access to the drain.
- Place a 20mm wood flat chisel between the ribs of the grate towards the sides where the ribs are strongest and rotate counter clockwise to remove the insert from the external ring.
- Note: If the internal ring will not move, use a shifting spanner open the jaws wide enough to fit the flat wood chisel and try to turn the internal ring... This should do the trick.
- If not use RP7 or similar to spray around the internal edge and then try the shifting spanner & wood chisel again.
- After the insert has been removed, use a damp cloth with a cleaning solution will remove most stains.

Step 2 continued:

- Just remember nothing will stick to the special material the base has been manufactured from.
- Hard to remove marks like glue, grout and cement will come away from the sides of the white base & cap with a little elbow grease.

Step 3:

Don't forget to give the grate an extra polish before inserting the internal ring back into the grate.

Make a mess! Nothing will stick to the Wondercap Drainage System hygienic material.
